Platform Used to test

We needed a platform to test our code and setups database. We used XAMPP for windows 11 and ran phpmyadmin off it. We followed this tutorial [XAMPP setup](#) to set up XAMPP. We then opened this on our computer and pressed start than admin on apache first (needs to be ran firs) then Mysql.

This opens up phpmyadmin which we could use to import the schema then our code and then the database to test.
